Airborne Magnetic Survey, June to September, 1961, by Aero Surveys Ltd.

No correction has been made for regional variation.

The planimetry for this map was obtained from topographical map sheets, published by the Department of Mines and Technical Surveys.

Air photographs covering this map area may be obtained through the National Air Photographic Library, Topographical Survey, Ottawa, Ontario.

The magnetic data on this map were compiled from in recorded along the flight lines shown. The anomalies express magnetic contours are dependent on the variable magnetic int the underlying rocks, and may be due to conditions near, or at depths below the surface. High magnetic anomalies normall the presence of basic rocks, such as diabase, gabbro, or serpent have a relatively high iron content, but in special instances ma or partly due, to concentrations of magnetic ore minerals. By the magnetic anomalies, various rock bodies or structural feat as faults or folds, may be traced into, or across, areas of few c crops. In many instances, however, no interpretation of part omalies may be possible without further geological information
