John: OWL data to date: there seems to be some correlation between last years geochem results and my mag. results. The major mag. anomalies are in the low, overburden covered area, not on the bluffs, in spite of the visible pyrrhotite up there.

Perhaps we should stake more claims — our coverage here is very minimal.

Pete

Ps: The position of the veccy soil lines is in some doubt — they may fit the mag anomalies even better than shown.

I'll keep you informed on our progress.
