

Small Faro Deposit

In order to attempt to outline if or where this zone might fit into the mining plan a trial analysis of the reserve tonnage and grade, and the total material movement was done. The results were encouraging and showed that approximately 2.9 million tons of 2.78% Pb and 4.76% Zn could be mined at a stripping ratio of 3:1 (waste to ore).

This work has better defined further work, such as diamond drilling, needed to allow a detailed mining plan to be developed.
