Re: In-field Processing, Anvil Airborne EM/Aeromag Survey

Doug--

Further to our recent discussions re provision of in-field processing by Aerodat in connection with the forthcoming AEM/aeromag survey for Avil Range, it is understood that Aerodat will provide an additional person to process the data in the field during the initial part of the survey, so as to ensure specified data quality and provide a rapid assessment of the initial data collected.

Specifically, Aerodat will supply a skilled data processor equipped with suitable microcomputer and HP Deskjet colour plotter from the date of survey commencement until the earlier of 14 production days or 1000 km of survey data (approx 25% of the total). During this period, the processor will reduce the GPS data and plot a provisional flight path map, check calculated GPS co-ordinates against published co-ordinates and topo features readily identifiable in the flight video, calculate and plot a provisiona total field magnetic map (corrected for diurnal), an EM profile map, and, if possible, a resistivity map from the low or intermediate frequency coplanar coil pair.

- 2 -

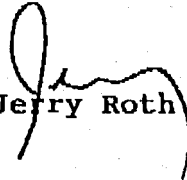

For this additional service Anvil Range will compensate Aerodat at the rate of \$1.25 per km of data so reduced and plotted.

After 14 production days or 1000 km of survey, Aerodat may, at its own cost, continue with in-field processing or have the processor return to Toronto.

In the event that in-field processing is discontinued, copies of digital data will be couriered to Toronto on a weekly basis or as appropriate, so as to permit processing at Aerodat's base office to proceed in a timely manner.

Please advise if there are any obscurities or questions re the preceding.

Regards.

Jerry Roth
