**MESSAGE:**

Enclosed is the carbon of the  
Dy Decline with pseudo interpretation! I'm  
also sending a blank section of the same  
Should you wish to change a bit. As  
we both know extreme arm waving occurred  
during the drawing of this cartoon! No  
correlation to BIX02 was possible with  
FAULT in 90DY-08. I have no basis  
to draw an orientation on this section...  
in other words pick a trend... any trend

could...

a lot of the fabric (shear fabric (?) within  
the gorge occurs at ~~slightly~~ slightly  
oblique angles to core axis. I will give  
this interval significant attention tomorrow AM  
and call you from Geom Security early in  
the AM. This interval should now be dry  
enough to begin dissection.

Also enclosed is a cartoon of the  
ESTIMATED trend of DY 90-09. It

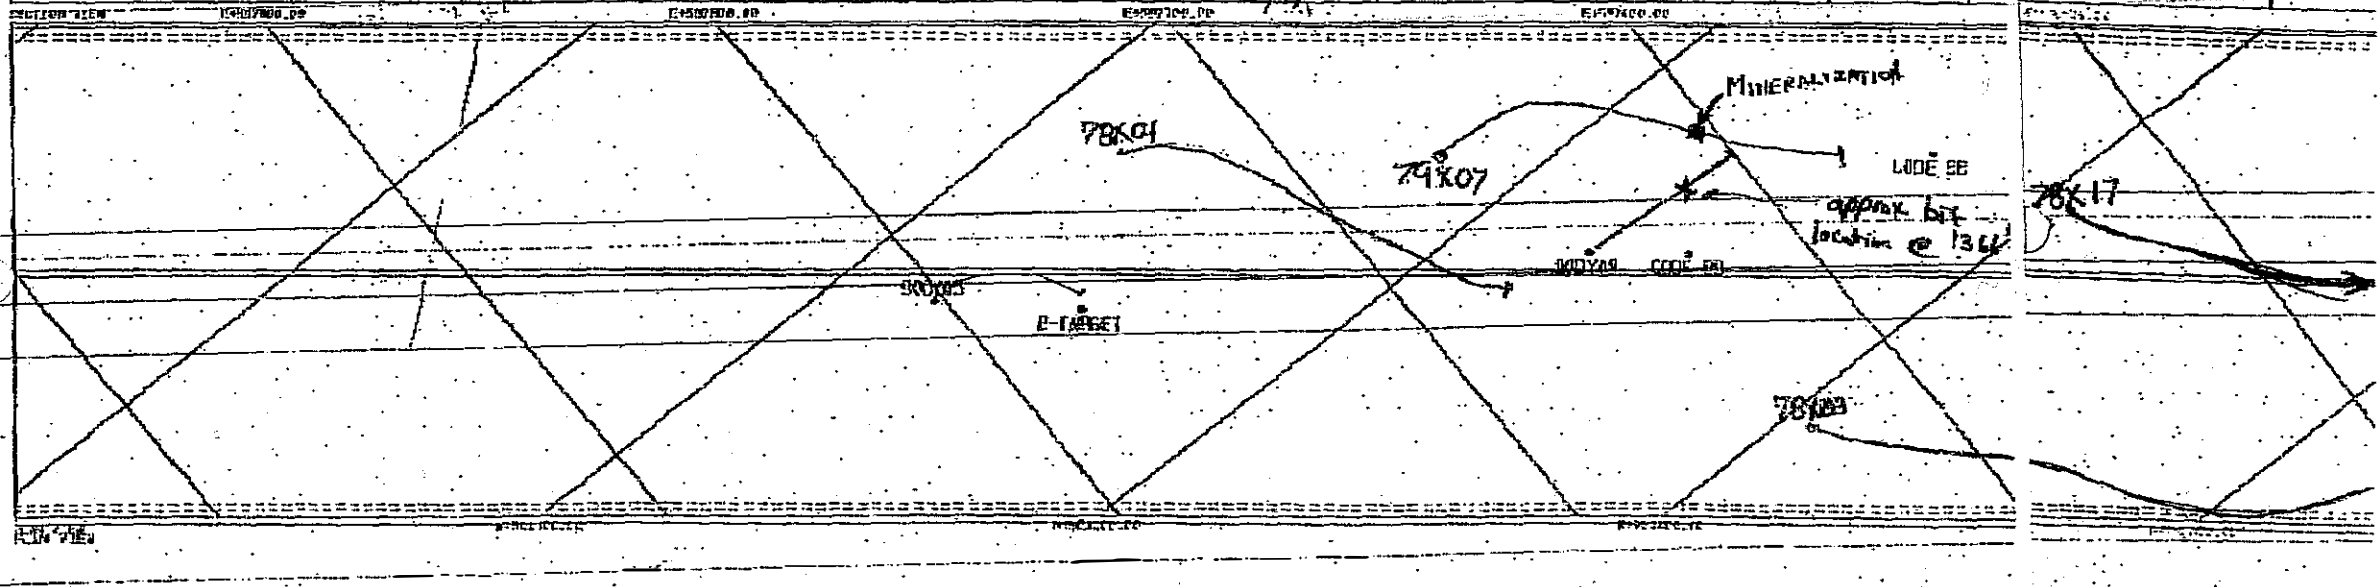

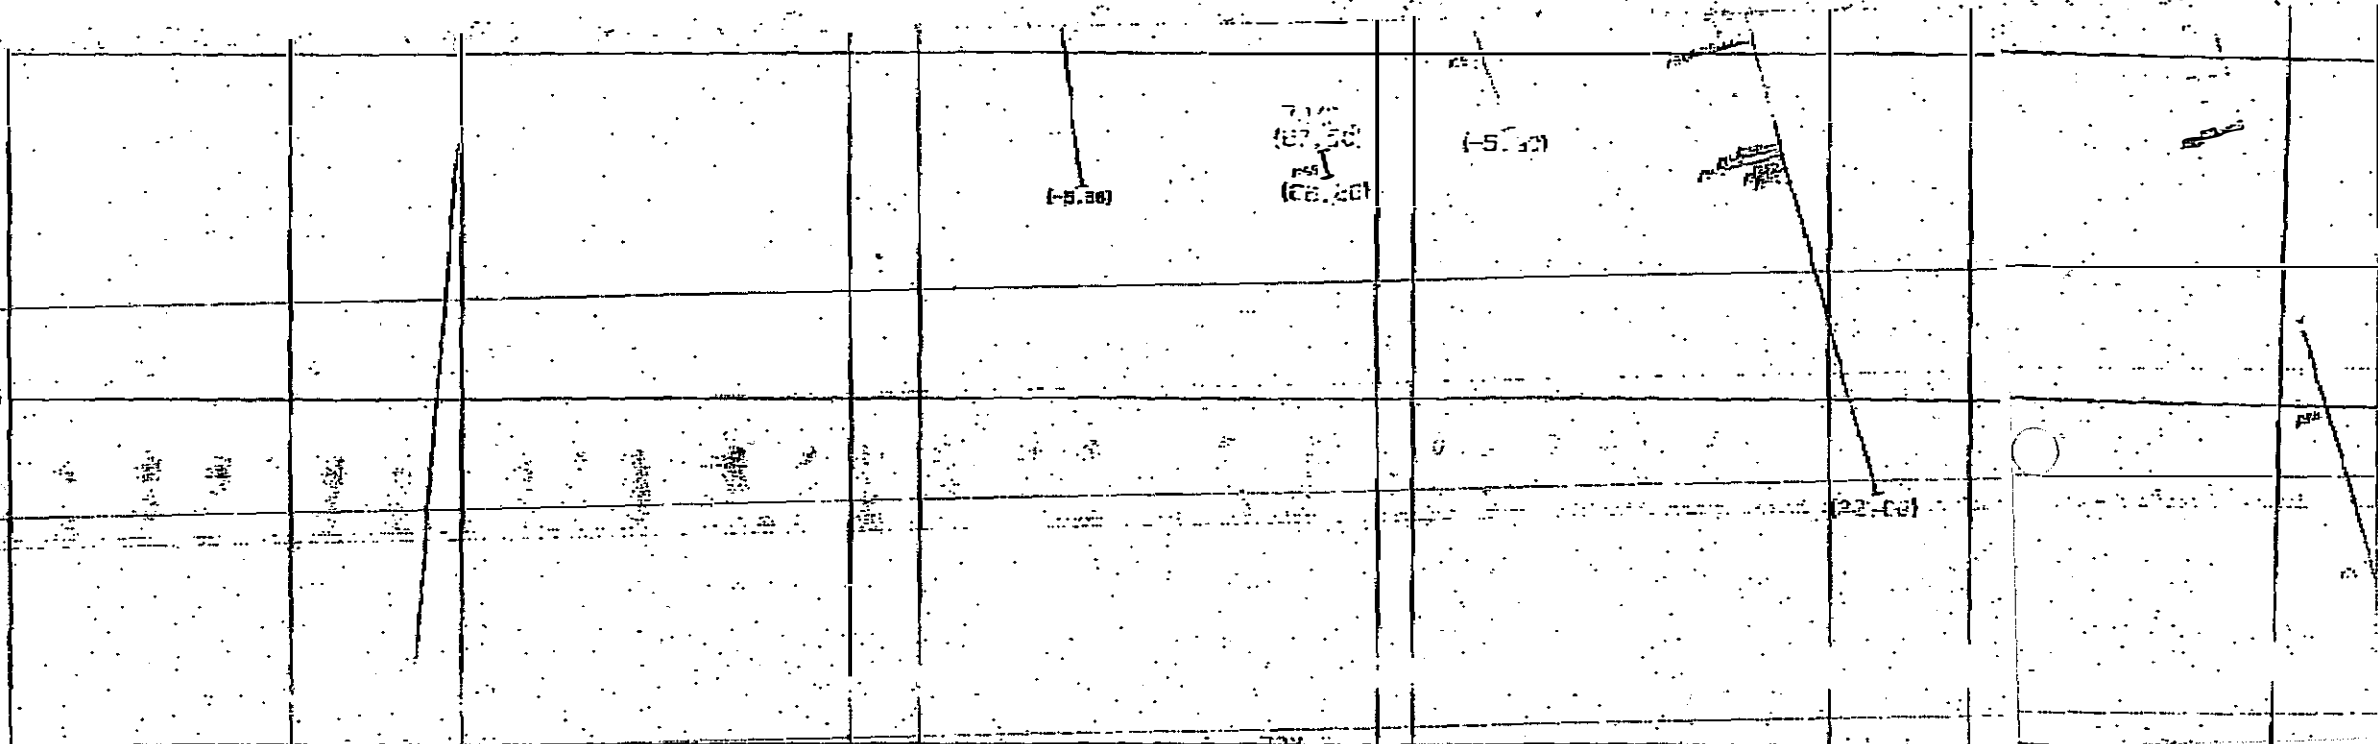

appears the mineralization could be intersected  
at approximately half way between the intersected  
point and the intersect point in 79X-07.  
This hole should better begin to rotate  
clockwise and pull farther from hole 79X-07!

I wish to stress this plot for 90 DY-09  
is based on 3 single shots using the 6"  
compass (A type). The readings look good  
to me although what they are telling us  
could be an ~~error~~ error for the future!  
Further single shot tests will be  
conducted AS AP.
