Lithologic Log

Date: Dec 11/90 Logged By: LCP

Code	From	To	Recov.	No.	Unit	Description
1	10 14	16 20	22 24	26 28	30 34	35
L	10	16		1	1*1	TILL Dominantly boulders of 10AB biotite-hornblende granite with white K-feldspar phenocrysts. Minor pale silvery grey, calcareous phyllite. Recovery about 15% - presumably till mud washed away
L	16	21		12	15IB10I	&2 (5DO) MINOR Soft, CS2-foliated, calcareous, pale grey phyllite. Well developed microlithon texture with thin quartz-calcite siltstone bands/laminae. S2 surfaces are silvery grey, locally with slightly greenish tinge. Core becomes slightly darker grey as go down DDH. S2 surfaces in this case pale steely grey. Contains minor thin interbands up to 5cm thick of pale olive grey, PS2-foliated, calcareous phyllite. Core moderately broken w/ good recovery. S2 surfaces generally fresh. Broken fracture surfaces locally have thin orange-brown iron oxide staining. No faults HQ core to 9.1m. Then NQ for rest of DDH
	21	213		13	5IDI0I	(5FO)(5B20) 90:05:05 Dominantly soft, PS2-foliated, pale olive chlorite-muscovite, calcareous phyllite. S2 surfaces are silvery olive. Contains thin qtz-calcite veins parallel S2 as well as diffuse calcite bands. Interbands of micaceous, thinly banded, olive green calcareous muscovite-chlorite phyllite (5F) and medium dark grey, calcareous, thinly banded, slightly carbonaceous phyllite (5B2). S2 surfaces for 5F are silvery olive - S2 surfaces for 5B2 are steely grey. Marginal contacts with 5D steep. Contacts between 5F and 5B transitional. Core mod. broken with good recovery. Locally minor iron oxide surface coatings on fracture surfaces. No faults

CURRAGH RESOURCES INC.

Lithologic Log

Date: Dec 11/90 Logged By: LCP

Code	From	To	Recov.	No.	Unit	Description
	10 14	16 20	22 24	26 28	30 34	35
	12.3	31.3		4	5 B 0 2	
						Soft, calcareous to very calcareous, CS2-foliated, medium-dark grey phyllite. S2 surfaces are silvery grey to silvery steely grey. Microlithons defined by calcareous phases siltstone bands. Contains minor quartz-calcite veinlets which are locally folded into D2 folds. At 31.7 have 40cm coarse quartz-dolomite veinlets partly brecciated and healed.
						Core mod. broken with good creamy S2 surfaces mainly fresh. Open fractures typically have thin mango-brown iron oxide staining.
	31.3	141.3		5	5 C 6	& @ (5FL) minor
						Soft, medium to dark green, noncalcareous, thickly banded chloritic phyllite. S2 surfaces are irregular, dark green. Interval crudely banded with 1cm - 30cm intervals containing 1mm subhedral pale cream ankerite (?) phenocrysts. Represents a relict igneous texture. Locally contains 20-50cm intervals of coarse white quartz-white ankerite veins.
						TOI - 34.7 consists of homogeneous, soft, pale green chlorite-muscovite phyllite. Contains 1cm euhedral pyrite grains. S2 surfaces are silvery cream. Thin interval is locally thinly laminated. Probably mixture of 5D and 5F.
						Core moderately broken. S2 surfaces and fracture surfaces have thin irregular brown iron oxide staining. No faults.
	141.3	145.7		6	5 F 6	
						Soft, pale creamy green, poorly laminated, noncalcareous muscovite-chlorite phyllite. S2 surfaces are silvery cream. Calcite occurs in thin crosscutting veinlets. Contains thick coarse quartz-ankerite veins. Poorly laminated, micaceous S2 surfaces suggest unit is metasediment. Lower contact gradational. Core mod. broken. No faults. Recovery good.

						Medium grey to dark grey, slightly calcareous to calcareous, soft, CS2-foliated phyllite. S2 surfaces are silvery grey to slaty grey. Microlithons defined by quartz-rich siltstone bands containing minor calcite. Isolated euhedral pyrite porphyroblasts.
						Core moderately broken. Recovery good. No faults.
						Note of mislabeled @ 48.8. About 0.5m core missing.
						EOH = 51.8 metres.

Code	From	To	Recov.	No.	Unit	Description
	10 14	16 20	22 24	26 28	30 34	36
L	00	28		1	1,1,A	GLACIAL OVERBURDEN. No core.
L	28	88		2	1,1,A	GLACIAL OVERBURDEN. Dominantly boulders of 10D quartz diorite with biotite phenocrysts set in a f.g-m.g. groundmass of white plagioclase and quartz and lesser 10EA diorite to granodiorite. Poor core recovery (~35-40%). Presumably till mud washed away.
L	88	100		3	1,1,A	GLACIAL OVERBURDEN. No core.
L	100	238		4	5B,0	(5B02) (5B07) 80:19:1 Medium to dark grey. Moderately to strongly calcareous (calcite, mostly). CS_2 foliated. Well-developed microlithon texture. Carbonate ± quartz ± carbonaceous material in siltstone bands/laminae. S_2 surfaces are silvery-grey, and rarely black or ochre (limonite). Fractures are rarely oxidized. Moderately hard. Good to very good core recovery (Mislatch occurred at 14.0, resulting in 1.8 metre core loss). Upper contact is broken. Lower contact is sharp at CA 50° (parallel S_2)
						Carbonaceous 5B2 unit is dark grey to black, calcareous and soft, with CS_2 foliation. Unit occurs sporadically within major unit. Fractures are black or ochre (limonitic). Good to very good recovery. Gradational contacts with 5B0 unit.
L	238	248		5	5D1	(5D0) 90:10 Olive green, locally white-buff. Moderately to strongly calcareous. Alternately soft (unsilicified) and hard (silicified). PS_2 foliation with siliceous bands subparallel to cross-cutting S_2. Fractures are silvery grey, olive green and ochre (limonitic). Very good core recovery. Sharp upper (CA 50°) and lower (CA 60°) contacts parallel S_2.

L	00	98		1	1 1 1 A	CASING: Overburden
L	98	133		2	5 C Ø 8	Medium greyish green. Weakly calcareous. Calcareous rock. PS_2 foliated with moderately well-preserved igneous texture. Unit hosts 25-30% strongly altered (± calcite, clay) feldspar phenocrysts (1-2 mm). Unit is moderately to strongly chloritized. Interval is moderately broken and soft. Fractures are rarely oxidized. Recovery is good. Upper contact is broken. Lower contact is sharp, parallel S_2.
L	133	160		3	5 F G 1	→ 5DØ (5DØ) 98:02 Greyish olive-green. Very weakly calcareous to non-calcareous. Slightly to moderately silicified. CS_2 foliated rock tends towards 5DØ. 5DØ occurs at 13.3-13.5 and is medium olive green. Moderately to slightly foliated. Slightly calcareous. 5DØ contacts are sharp and parallel S_2. Interval is moderately to strongly broken, hard, with good recovery. Colour of S_2 surfaces are medium green and very rarely oxidized. When oxidized, oxidization is very weak. Interval contains Ø-2% clotty pyrite (1-2 mm).
L	160	185		4	5 C G 1 $	Medium greenish and medium grays, moderately dolomitic rock is PS_2 foliated and preserves a moderately well-preserved igneous texture. Unit contains 10-35% dolomitized and clay-altered? feldspar phenocrysts (1-3 mm). Interval is moderately to strongly broken with moderate limonite along fractures. Recovery is good. Upper and lower contacts are sharp and

						is rare and weak. Py is rare <1%. Rock is moderately soft, moderately broken, rarely strongly broken. Minor gouge occurs in 3-4cm bands at 77.9-78.3. Upper and lower contacts are sharp and parallel S_2
	84.2	100.0			1500	Medium green, strongly calcareous unit contains a very well preserved igneous texture with a weak to slightly moderate PS_2 fabric. Unit contains 3-10% weakly chloritized 1-3mm mafic grains and trace-20% leucocene (<1mm). Interval is slightly soft, slightly broken rarely strongly broken. At 96.6 to 94.9 40% of interval is strongly broken and moderately oxidized along fracture planes. Recovery is good throughout. Upper contact is sharp parallel S_2 and noted as containing a very strong PS_2 fabric and a very poorly preserved to not recognizable igneous texture over 0.6m, (possible SDG??) Lower contact has not been cored.

						contact at CA 55°. Gradational lower contact.
L	16.3	17.2		006	5BØ	5FØ (5BØ2) 98:02
						Medium grey phyllite with ochre bands (limonite), cut by buff-white carbonate-quartz laminae following S_1. Moderately to strongly calcareous. CS_2 and PS_2 foliated. Silvery grey and ochre (limonite) coloured fractures. Moderately hard. Very good core recovery, RQD. Gradational upper contact. Sharp lower contact at CA 70°-80°. Very weakly chloritic.
						Slightly more carbonaceous subunit occurs as bands subparallel S_2 up to 0.1m wide. Dark grey. Moderately calcareous and hard. CS_2-foliated. Silvery grey to black fractures. Gradational contacts with 5BØ→5FØ.
L	17.2	33.3		007	5B2	~~(5B2) (5B) 98:02~~
						Dark grey to black phyllite, with buff-white carbonate-quartz veinlets subparallelling S_2. Moderately to strongly calcareous. Strongly CS_2 and PS_2 foliated. Contains 1-2% pyrite as disseminated euhedral to subhedral crystals (<3mm) and as bands (<2mm wide) subparallel $S_2 \geq S_1$. (Pyrite sometimes is altering to limonite). Moderately hard to soft. Silvery grey, black (graphite), ochre (limonite after pyrite?) and rare brick red (hematite) colours on fractures. Very good core recovery. Good RQD. Sharp upper contact. Gradational lower one.
						Carbonate-quartz vein/veinlet bearing 5B2 occurs above 20.5. Buff-white, hard, calcareous (calcite). PS_2 foliated. Gradational contacts with 5B2.
						Medium grey ~~metabasite~~ quartz vein subunit at 32.8-33.0 moderately calcareous, hard, ochre-stained and has gradational contacts with 5B2.
