Wilfred Kennedy, a Toronto prospector, submitted a report on the Itzi Claim group on Canyon Creek, a branch of Fuller Creek, 3 miles southeast of Fuller Lake. The area lies approximately 250 miles north of Johnsons Crossing along the Canol Road and about 12 miles west of the Canol Road itself.

Beaton's report describes a narrow pyrrhotite filled fractions from 3 to 5 feet wide on the side of a steep canyon on Canyon Creek, $\frac{1}{2}$ mile southwest of its junction with Fuller Creek. A series of chip samples taken at irregular intervals along an exposed length of 300 feet, averaged \$12.36 in recoverable values of silver, lead and zinc.

Kennedy says the 'break' is about 2,000 feet long but has no further samples. He thinks the showing deserves further prospecting and sampling.

Due to its inaccessibility and low grade, it appears to be of no interest.

E. O. Chisholm
Chief Geologist.
