Subject Grum Assay Database
Telephone conversation with John Maissan, Faro

Additional elements which should be analyzed in the Grum assay sample include:

	<u>Priority</u>
Ba	1
Hg	1
As	2
Mn	2
Sb	3

Metallurgists are interested in:

- 1) Distribution of these elements through the geographic area of the ore body.
- 2) Expected values of these elements for each ore type.
- 3) Possible correlation of analytical results with specific minerals for each ore type.

Enough samples should be analyzed to result in statistically significant answers to the above three concerns.

They would appreciate advance warning of possible metallurgical problems during the expected mining sequence of the deposit.
