The only thing I would add to Angus's Report on the above property is to say that the Askania Magnetometer operated effectively over at least 3,000' of the base line. This distance would have covered both the anomalous area found with the S.P. equipment and the gossan area, itself. The instrument ceased to function after we were south of the immediate area of interest.

No significant magnetic anomaly occurred either over the S.P. anomaly or over any part of the gossan.

William M. Sirola.
