SUBJECT: Acid generation potential of rock samples

---

Enclosed is the Certificate on Analysis from Chemex Labs for the three rock samples that we submitted for acid-base accounting. The samples are coded as follows:

- 88-RR-1 Pit side wall, conglomerate
- 88-RR-2 Outcrop half way down slope towards highway, fine conglomerate plus a micaceous sandstone
- 88-RR-3 Adjacent to highway, conglomerate

The results indicate that all three samples have very low sulphur content and, essentially, no capacity to produce acid and no capacity to consume acid. The rock represented by these samples can be regarded as inert and should have no adverse effect on water quality when submerged in a lake.

Please contact me any time if you have further questions.
