

#10 Serpentine ^{and} Black looking shist.

#7 Quartzite with a lime body at the lower end. the limestone has a few specs of Galena in it bellow that there is some serpentine with some slip fibers.

THE RED SPOT

Close to Forty Mile is newer Volcanics but it is odd looking as it looks like clinkers and when you break it there is Obsidian Glass in it not far from there there is a small body of serpentine accross the forty mile there is a little serpentine with a little fiber. On the Yakon River marked on map (A) I found some real good fiber but not enough of it
