SUBJECT

Toy 1-6

MESSAGE

Adamsen has just returned from Toy and reports that the main Toy showing appears to have no significant strike length. A continuous trench was put around the show and the zone could not be followed. Adamsen estimates a dimension of about 10' x 30'. It appears that the shear extends outward from a shear zone-dyke on the ~~west~~^{west} side of the show & that intensity of replacement supply died out to the east. A small map anomaly occurred over the show but could be traced only 30' along strike. No float (thin cover area) could be found anywhere to the east along strike. Geochem. was done along strike also & results will be in soon.

It is recommended that the Toy 1-6 option be dropped if geochem shows no results. If high geochem I will inform you. If no geochem. will not mention and C/S assume OK to notify Hugo that dropped. Will await confirmation.
