J. G. Simpson

SUBMITTALS: A. KULAN - ANVIL AREA, Y.T.

In view of the situation with regard to Al Kulan's submittals, I enclose an examination report on the Soy claims and pertinent information on the Pelly airborne EM/Mag proposal as requested. I apologise for not being more definitive about the proposed reconnaissance area, but without poking around on the ground on my own, which is just about impossible without Kulan's knowledge, there is not much more I can do.

P.S.Rock Geochemical Results - Soy Claims - In p.p.m.

Sample #	Cu	Pb	Zn	Ag
1	32	64	125	0.6
2	93	86	135	8.2
3	115	57	180	2.7
4	19	42	79	0.8
5	-	52	200	7.0

The only result remotely anomalous for this area is the 8.2 p.p.m. Ag, which originates from a very altered manganiferous shear zone. I would suggest that this makes the Soy property a poor bet on the basis of comparisons with rock geochemical data from the Faro area.
