Lithologic Log

Date: APRIL 12/88 Logged By: CUR

Code	From	To	Recov.	No.	Unit	Description
	0	157	4	1	#	Overburden - Tricone set No Recvy.
	157	11213	6	2	##	Overburden 10 AB Anvil Batholith boulders & fragments separated by sporatic amounts of dull-tarnish grey mud-clay. Mud clay contains various rounded & subangular pebbles of 10AB, 3C, phyllites, siltstones?... Ratio of boulders to mud clay 60:40. Boulders range in size up to 1.6' Ø.
	11213	12717	2	3	3G10	Moderately soft, medium grey, dominately PSz? foliated, noncalcareous, mosc phyllite Sz? surfaces range from light steely-grey to dark grey. Dark grey surfaces only slightly mark fingers. Contains local thin foliaform q/z veins which range in thickness up to 5" Ø. Commonly, these veins have thin green chlorite selvages & contain minor Po + Py infilling fractures. From 701 → 160', Sz surfaces show rusty orange weathering coatings. Unit contains local thin fractures both // & X-cutting Sz which are infilled w/ calcite. Minor gouge at 162'. 701 → 133 extremely broken & "poker chippy". Loss of 3' of core. Breakage due to nature of rock - not faulting. 133 → 149 very broken, especially near end of runs. 3½' lost core between 138.5 & 143. 3' lost core between 143 & 149. core loss likely not due to faulting. 149-166 very broken w/ local rubble especially near end

						490.6 → 505.0 Core very broken w local minor gouge. 2' of core loss between 491' & 497'.
						505. → EOI Intact → locally slightly broken. Recry GOOD
	1514 9	1515 0		18	3610	I GOUGE ± Bx I B10
						Basically same unit as above except for local occurrence of gouge + breccia. Minor thin gouge intervals generally < 1" thick occur at TOI, 557.3', 553.2', + within rubble at 356'. Gouge is generally // to dominate foliation however locally associated with steep fractures which are < 15° to core axis. Bottom of interval is sharp against qtz vein.
						Core very broken w local rubble. Recry is GOOD
	1515 0	1516 1 9		19	1010	B10 + chl Bx hard
						Mottled dark brown, white, + pale green ^ biotite rich qtz vein. Contains approx 50% B10 35% Qtz 15% chl. Contains abundant thin fractures infilled w Py. Qtz occurs in white pegmatitic "eyes" up to 2" ∅ + in fractured + displaced veins up to 1" thick. Qtz also occurs more finely dissem within biotite bands. Biotite bands are fractured + displaced + range up to 4" thick. Chlorite occurs both as thin selvages to qtz and in thinly laminated bands up to 1½" thick. This unit has an overall brecciated texture which may be a result of ductility contrasts between qtz, bio + chl. Locally small rotated qtz clasts are seen within biotite rich bands.

Lithologic Log

Date: March 31/88 Logged By: CVR

Code	From	To	Recov.	No.	Unit	Description
1	10 14	16 20	22 24	26 28	30 34	35
						98.6 → 103.0' core is moderately broken, recvy O.K.
						103 → 105.0' core is very broken w local rubble 0.8' of core loss.
						105' → 111.8 moderately broken, Recvy O.K
						111.8 → EOT rubble w gouge. Not a major fault.
						- Calcite locally infills thin fractures. Sz surfaces medium grey w abundant pale green chlorite clots
	1112 2	1219 2		15	BGIO	Bio → [ICO] (10Q) 85:15 Local crenulation cleavage
						Moderately soft, noncalcareous, dominately PS2? foliated, musc + chl + bio phyllite. Chlorite laminations + biotite are more abundant than higher units. Chlorite commonly occurs in thin green selvages around qtz veins. Chl also infills fractures in qtz. Biotite commonly occurs in thin selvages to chlorite. Unit contains
						abundant white pegmatitic qtz veins which range in thickness up to 15 cm. Qtz veins are foliaform + locally contain Po & Py infilling thin fractures. Local development of very fine
						"speckled" andalusite? associated w chl + bio rich laminations. Sz surfaces are medium grey w abundant pale green chlorite clots. No major faults.
						TOJ - 115' core is very broken w local rubble. 1.5' of core loss.
						115' → EOI core slightly broken. Recvy is good.
						Because of ↑ in bio + andalusite and moderately coarse appearance of this unit, it is transitional to amphibolite facies.

	1 1 2 9 2	1 1 4 9 0		1 6	B G 1 0	Bio → [ICO]
						Pale green, grey, + brown "striped" noncalcareous, moderately soft musc + chl + bio phyllite. Separated from higher unit
						because less abundant qtz veining. Sz surface is a medium
						"steely" grey with abundant pale green chl clots.
						Local microlithon texture defined by bio + chl laminations.
						Biotite becomes less abundant moving down the interval.
						No major faults. No visible andalusite. Core moderately
						broken along dominant foliation + locally along steep fractures
						Recy is GOOD.
	1 1 4 9 0	1 1 5 1 2	1	1 7	1 3 C 1 0	
						Homogeneous, pale olive green, noncalcareous metabasite.
						Unit is slightly harder than higher phyllites. Upper + lower contacts
						are sharp and // to the dominate foliation. Local fractures
						are infilled w chl and minor PO. At 150' fracture is
						infilled w Po + rimmed w chl. Local "splashy" Cpy associated
						with Po of this location. Unit exhibits a diabasic texture
						~~core~~ overall.
						Core is intact. Recy is good.
	1 1 5 1 2	1 1 6 1 2	1	1 8	1 3 G 1 0	Bio → [ICO]
						Same as unit #6.
						TOI - 154.6 core badly broken + rubbly minor incipient
						gouge. Recy is O.K.
						154.6 - EOI core moderately broken. Recy is good.

1	10 14	16 20	22 24	26 28	30 34	35
						sharp and // to the dominate foliation.
						TOT → 185 core slightly broken along steep fracture. Recy is good
						185 → 186 rubble due to steep fracture. Recy O.K.
						186 → EOT core slightly broken. Recy is good.
	1 1 9 5 0	2 7 6 0		1 1 2	1 3 6 10	Bio → [ICO]
						Overall colour is a dark brownish, grey-green. Unit
						is moderately soft → locally hard, noncalcareous, locally shows
						a recrystalization cleavage. Sz surfaces vary, from a pale
						greenish grey to dark greenish grey. Dark brown bio
						is abundant & locally defines at least two cleavages.
						Unit becomes coarser down the hole w/ local occurances
						of prograde andalusite porphs. Porphs are generally < 1mm Ø
						This unit is approaching amphibolite facies. Local quartz
						veins are common w/ minor Po + Py infilling fractures. Calcite
						occurs in locally abundant, thin, X-cutting fractures.
						Core intact → locally slightly broken. Recy is good.
						Mis-latch at 231'. No obvious faults.
	2 7 6 0	3 4 7 5		1 3	3 B 4	± I ± BxA ± GOUGE
						Moderately soft → locally hard, pale olive green, laminated,
						slightly altered, chloritic phyllite/gouge/BxA. Unit contains abundant thin
						disrupted grey qtz laminations which range in thickness
						from < 1mm to 1cm. Abundant intervals of incipient gouge.
						Unit is locally brecciated. Gouge intervals range from 2cm
						to 4' thick. Locally rotated clasts + fragments of qtz + 3B

Lithologic Log

Date: APRIL 1/88 Logged By: CVR

Code	From	To	Recov.	No.	Unit	Description
1	10 14	16 20	22 24	26 28	30 34	35
	0.0	115.92		11	#	Overburden - Triconed - No recov.
	115.92	121.26		2	#	
						Overburden 10 AB granitic boulders + fragments ranging in size from 1cm to 30 cm ϕ. From 182' to 226', tannish grey mud/clay rec'd between the boulders. Clay contains small pebbles + fragments of 10 AB and thinly laminated musc + chl phyllites
	121.26	121.80		3	#	TRICONED - NO RECOV
	121.80	131.05		4	I C O	± Garnet ± Ankerite? Siderite? Moderately hard, light grey w brown & tannish green laminations, musc + bio + chl, ± garnet ± ankerite? phyllite. Foliation surfaces are "mottled" dull greenish-grey + brown. Laminations are fairly thick & defined by biotite, chlorite, & ankerite? Unit is PS2? foliated. At 305.8 local developement of small, subhedral, -up to 2mm ϕ- pinkish brown garnets. Garnets are associated w chloritic selvage to a foliaform qtz vein. Local patchy developement of biotite gives the core a local "freckled" appearance. The unit is fairly coarse, w only a moderate amount of chlorite. It is much more biotite rich than typical 3G + therefore appears more like 1C of Faro than 3G at Vangorda. Thin creamy - tannish - green laminations when powdered react slightly w 20% HCL. These laminations vary in thickness -up to 1cm + appear locally throughout

Code	From	To	Recov.	No.	Unit	Description
1	10 14	16 20	22 24	26 28	30 34	35
						in 20% HCL. S_2? surfaces are a dull tan-grey w/ patchy biotite.
						Core is intact. Recy is good.
	316.93	401.67		18	1H14	* ank? dol? sid? [1C04*]
						pale greenish Whitish-V tan, soft, poorly laminated, altered musc+chl phyllite. Foliation surface is a dull light greenish V tan and white talc? rubs off on fingers. When unit is powdered it reacts with 20% HCL. Unit is badly broken + contains thin intervals of white powder-mixed gouge. Very small cc/mm pyrite porphs locally occur in highly altered, very soft, whitish green intervals
						TOI → 370.6 slightly broken recy O.K.
						370.6 → 376.9 core very broken with 2" thick gouge at 374'. Gouge // to dominate foliation
						376.9 → 382.3 Rubble w/ thin intervals of white powdery gouge. Recy is O.K.
						382.3 → 391 - Very broken + rubbly. 6" gouge zone centered at 386.3. Recy O.K.
						391 - 401 Rubble. Powder gouge 400 - 401. Loss of 4' of core near gouge zone at 400'.
						401 - EOI core is very broken w/ white powdery gouge at 405.7 → EOI. 1.5' of core loss likely in gouge zone at 405.7
