Attached is a small map, taken from United Geophysical's "Bouger" map dated September, 1964, and showing the location and attitude of a 750 foot, 45° dipping hole which Crone has spotted to test the gravity anomaly. In spotting it he to some extent took into consideration the E-M picture.

Please let me know if you agree with its location. Considering the probable northerly dip of the source of the anomaly, you may think that the hole is collared a little too far south.

Paul M. Kavanagh  
Chief Geologist - Exploration.
