ISOMAGNETIC LINES (absolute total field)

- 500 gammas
- 100 gammas
- 20 gammas
- 10 gammas
- Magnetic depression

Magnetic survey, March 1968 to June 1968, by Aero Photo Inc.

The magnetic data on this map were compiled from information recorded during the aeromagnetic survey. The anomalies expressed by the magnetic contours are due to the variable magnetic intensities of the underlying rocks and to the magnetic induction produced at various depths below the surface. The magnetic anomalies normally indicate the presence of igneous rocks, such as gabbro, or serpentine, which have a relatively high magnetic intensity. In general, the magnetic intensity decreases with increasing distance from the magnetic source.
