

The TIE claim group, in the vicinity of the grid system composed of a 4,000 foot baseline with picket lines at 400 foot intervals, is underlain by schistose rocks of unit 7 (see Map 13-1961) Granitic rocks intrude the northeasterly section of the area.

Foliation attitudes in the schistose rocks are generally east-west with shallow dips to the south. The sequence in the schistose rocks appears to consist of a calcareous unit overlain in turn by talcose sericite schist, sericite schist and chlorite schist.

The survey does not cover the entire grid but  
outlines only the conductor as up by the arbors
