The enclosed map indicates a total of seventeen rotary holes drilled in 1971 by Anvil Mining Corporation within the confines of the Vangorda Mines property. This information came to light when Dr. Aho loaned me a copy of a geological map prepared by Anvil Mines.

I telephoned Uldis Jansons, Chief Exploration Geologist at the Faro property and he confirmed that this work had indeed been done by Anvil. He remarked however that transgression on to Vangorda Mines property was not deliberate and that the drill holes were drilled principally for overburden testing and rock geochemistry. He also said that he would send us the results of the drill holes. While there may be some truth in what Mr. Jansons has said, one certainly wonders about a row of drill holes which begin on the Champ deposit and are drilled methodically down-dip from that deposit. I refer to drill holes 71-179, 180, 181 and 201. There is also drill hole 71-200 drilled off the southeast end of the same deposit.

Until we receive the results of this drilling it is difficult to know what inferences can be drawn from this work. Drill hole 71-173 is certainly close to one of the areas which interested Dr. Aho and, in point of fact, his drill hole A-1 is only 150 feet southeast of 71-173.

I can appreciate that it is sometimes difficult to locate oneself precisely in the field but most of the drill holes on the Vangorda property are well marked and I can hardly think that one would start drilling on the Champ deposit by accident.

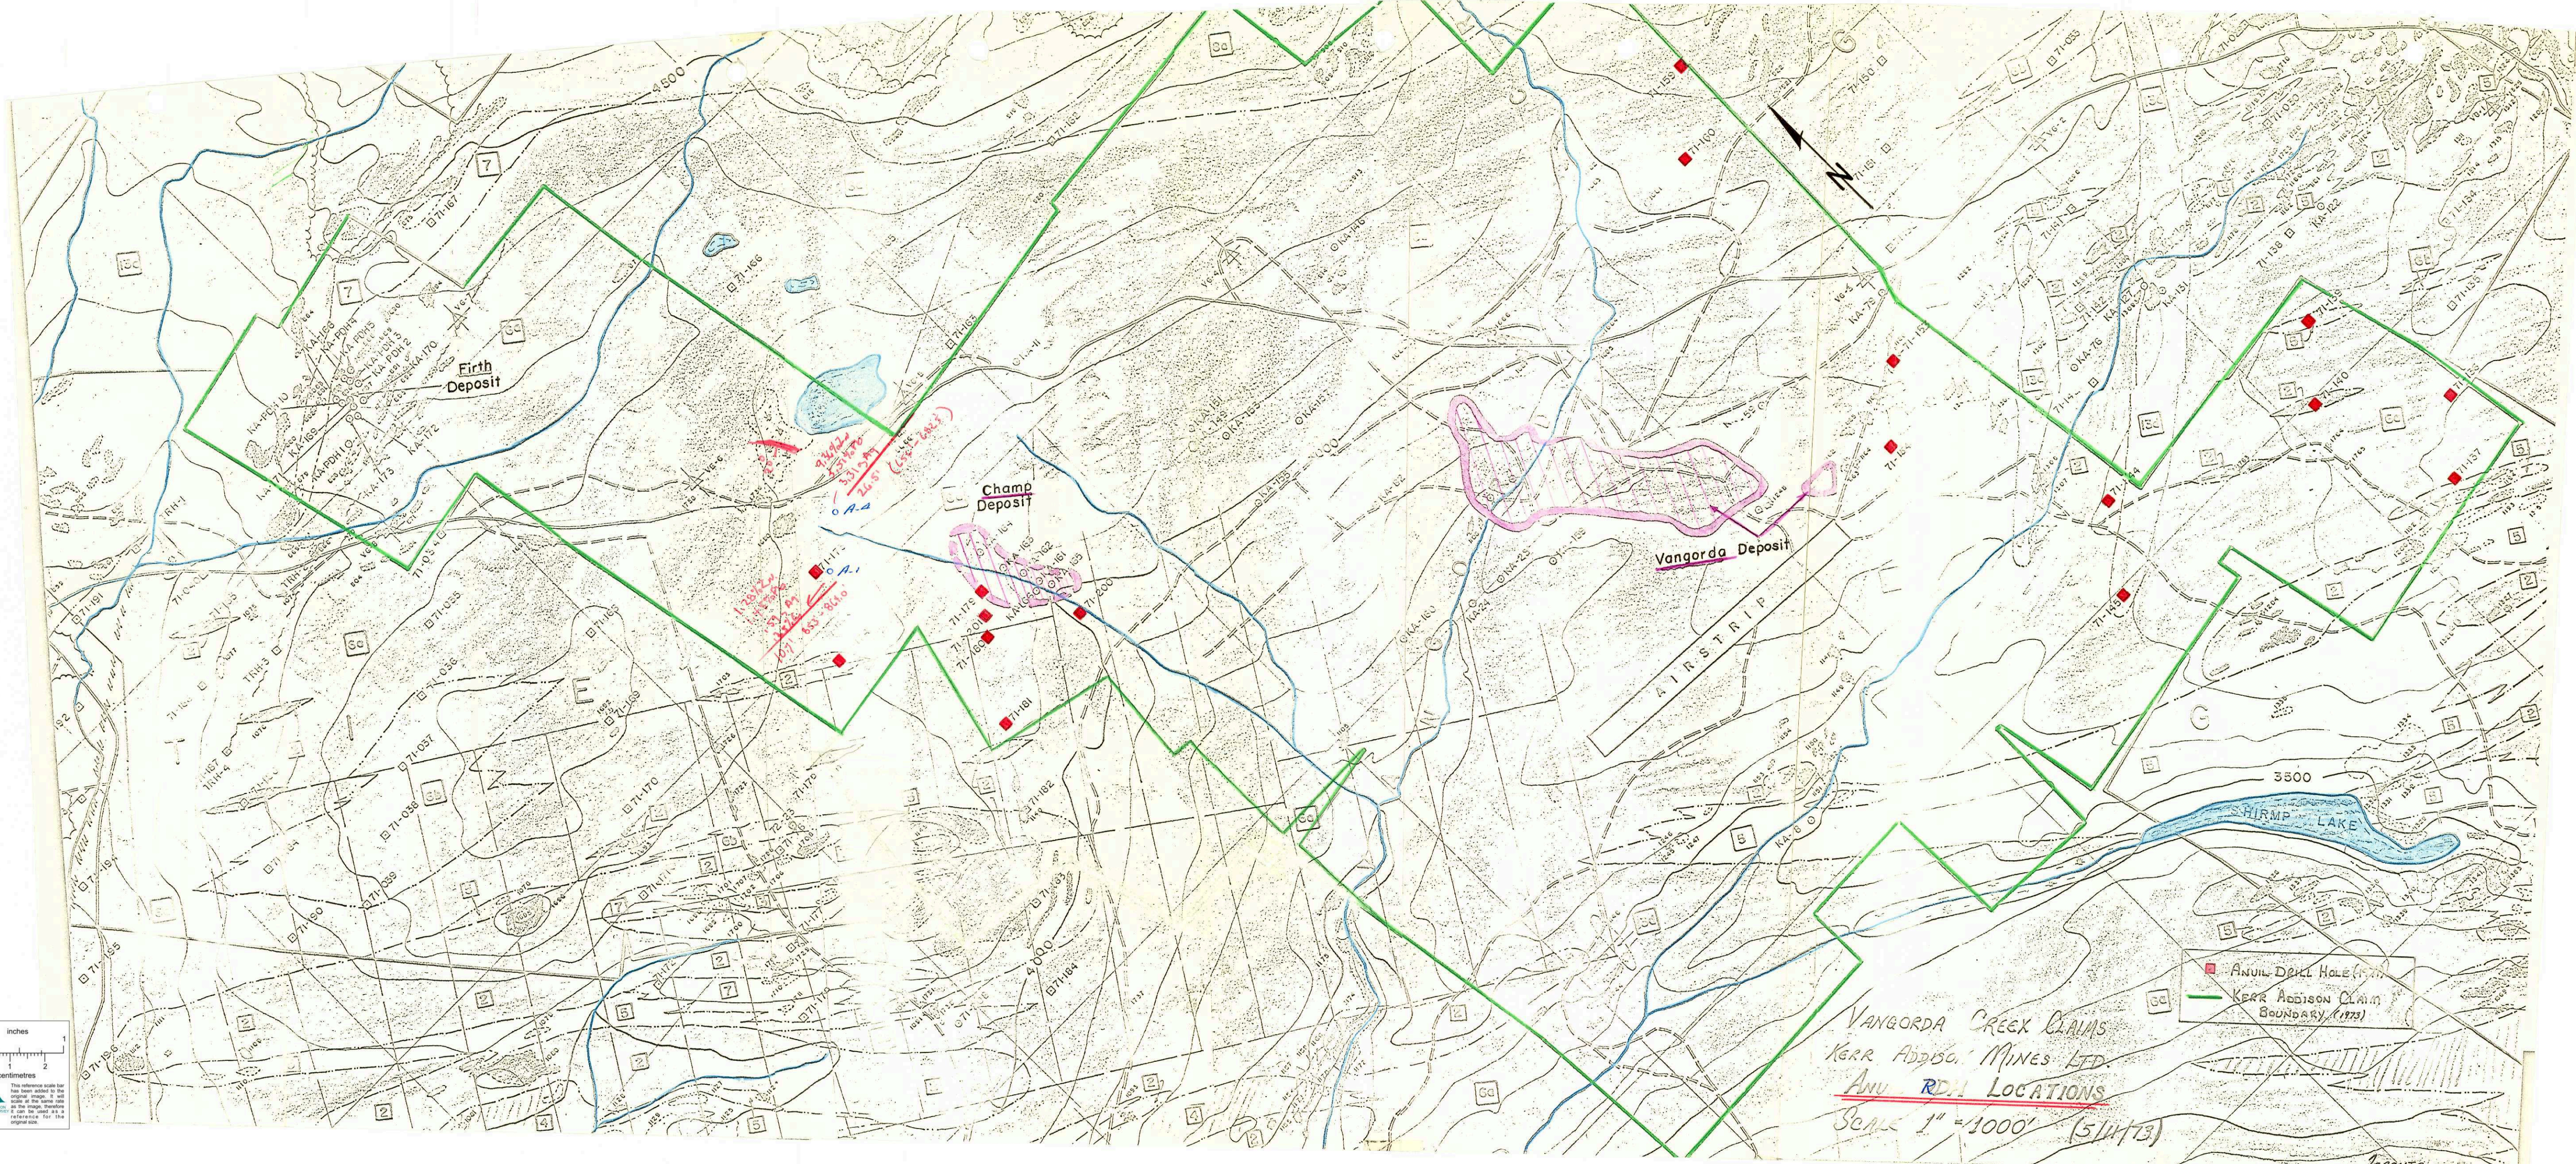

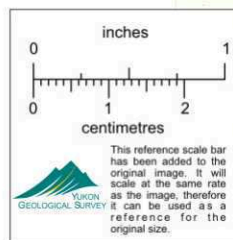

It is too early to draw any real conclusions about this drilling except to say that it does appear deliberate in part. I will forward the drilling results to you as soon as they arrive here.
