LEGEND

QUATERNARY

Q Unconsolidated alluvium, colluvium and glacial deposits

EOCENE(?)

11 Medium to coarsely crystalline syenite. Predominantly randomly oriented pink K-feldspar crystals with lesser dark green hornblende.

DEVONIAN to MISSISSIPPIAN
EARN GROUP

10 Dark grey to black, carbonaceous shale, siltstone, chert and siliceous limestone. Weathers recessively to pale bluish-grey.

MIDDLE DEVONIAN

9 Buff- to grey-weathering, medium grey, argillaceous limestone. Micritic with the exception of local thin grainstone beds (< 10 cm) containing *Gastereocoma bicaula* and other crinoids. Black calcareous shaly partings between more resistant limestone beds.

8 Buff-weathered, platy, dark grey siltstone, very fine-grained sandstone and fissile, silty shale. The siltstone and sandstone are dolomitic and finely micaceous. They exhibit fine parallel laminae and contain scattered crinoid and brachiopod fragments.

ORDOVICIAN to SILURIAN
ROAD RIVER GROUP

7 Dark grey to black, locally calcareous, graptolitic shale or siltstone with lesser very fine-grained sandstone, chert (porcellanite) and limestone. The unit weathers recessively and contains few brachiopods, and crinoids.

LOWER PALEOZOIC (AGE UNCERTAIN)

6 Grey to buff, quartz-rich sandstone to pebbly grit. Grains are subround to round. Contains beds up to 2 m thick of heavily burrowed, slightly dolomitic, very fine-grained sandstone and siltstone.

5 Mottled light to dark grey dolostone. Micritic to sugary, local black chert nodules present. Weathers light brownish-grey to buff.

4 Grey- to tan-weathering limestone. Massive, finely crystalline and barren of fossils (after Burt, 1983).

PRECAMBRIAN TO LOWER PALEOZOIC (AGE UNCERTAIN)

3 Green to grey, locally greyish-red, banded siltstone with very fine-grained sandstone. Sandstone beds, 1 to 5 cm thick, are quartzose, internally laminated, and graded. The unit also includes soft sediment deformation, minor green matrix-supported conglomerate beds, and starved ripples.

3a Greyish-red, clast-supported conglomerate. Clasts are subangular to subround, commonly pebble to cobble size (maximum 40 cm across). Clasts predominantly basalt with lesser amounts of vein quartz, carbonate, and sandstone. Unit is up to 20 m thick.

2 Black, silty shale, platy to fissile. Weathers medium grey to rusty. Contains wavy parallel laminae spaced 2 to 10 mm.

1 White to light grey quartzite. Very fine-grained to sugary, massive to faintly laminated.

SYMBOLS

Geological contacts (defined, approximate, assumed, covered).....	
Fault, displacement unknown (defined, approximate, covered).....	
Limit of mapping.....	
Metamorphic hornfels line (symbol on higher grade side).....	
Limit of outcrop.....	
Bedding (upright, overturned).....	
Dominant foliation (transposition foliation; commonly parallel to compositional layering; inclined, vertical).....	
Fold axial surface trace (antiform: upright, overturned; synform: upright, overturned).....	
Line of cross-section.....	
Gossan.....
