**PCH** HYLAND: consists upwards of coarse turbiditic clastics (1), limestone (2), and fine clastics typified by maroon and green shale (3)

PCH1	limestone; phyllite, quartzofeldspathic, and micaceous psammite, gritty psammite, and minor marble
PCH2	HYLAND: grey weathering, dark grey to grey white, thin to thick-bedded, very fine crystalline limestone, locally sandy; calc-silicate and marble; may locally include carbonate members within (1) or (4) HYLAND: grey weathering, dark grey to grey white, thin to thick-bedded, very fine crystalline limestone, locally sandy; calc-silicate and marble; may locally include carbonate members within (1) or (4)
PCH3	HYLAND: distinctive, recessive, maroon weathering, interbedded maroon and apple-green slate; "Oidhamas" trace fossils; rare grey chert; locally basal member and interbeds of quartz siltstone, sandstone, and quartz-pebble conglomerate
PCH4	HYLAND: quartzose clastic rocks as described in (1); mostly(?) equivalent to (1) but may include younger units
